

Dynamic masks interfere with iconic but not visual working memory

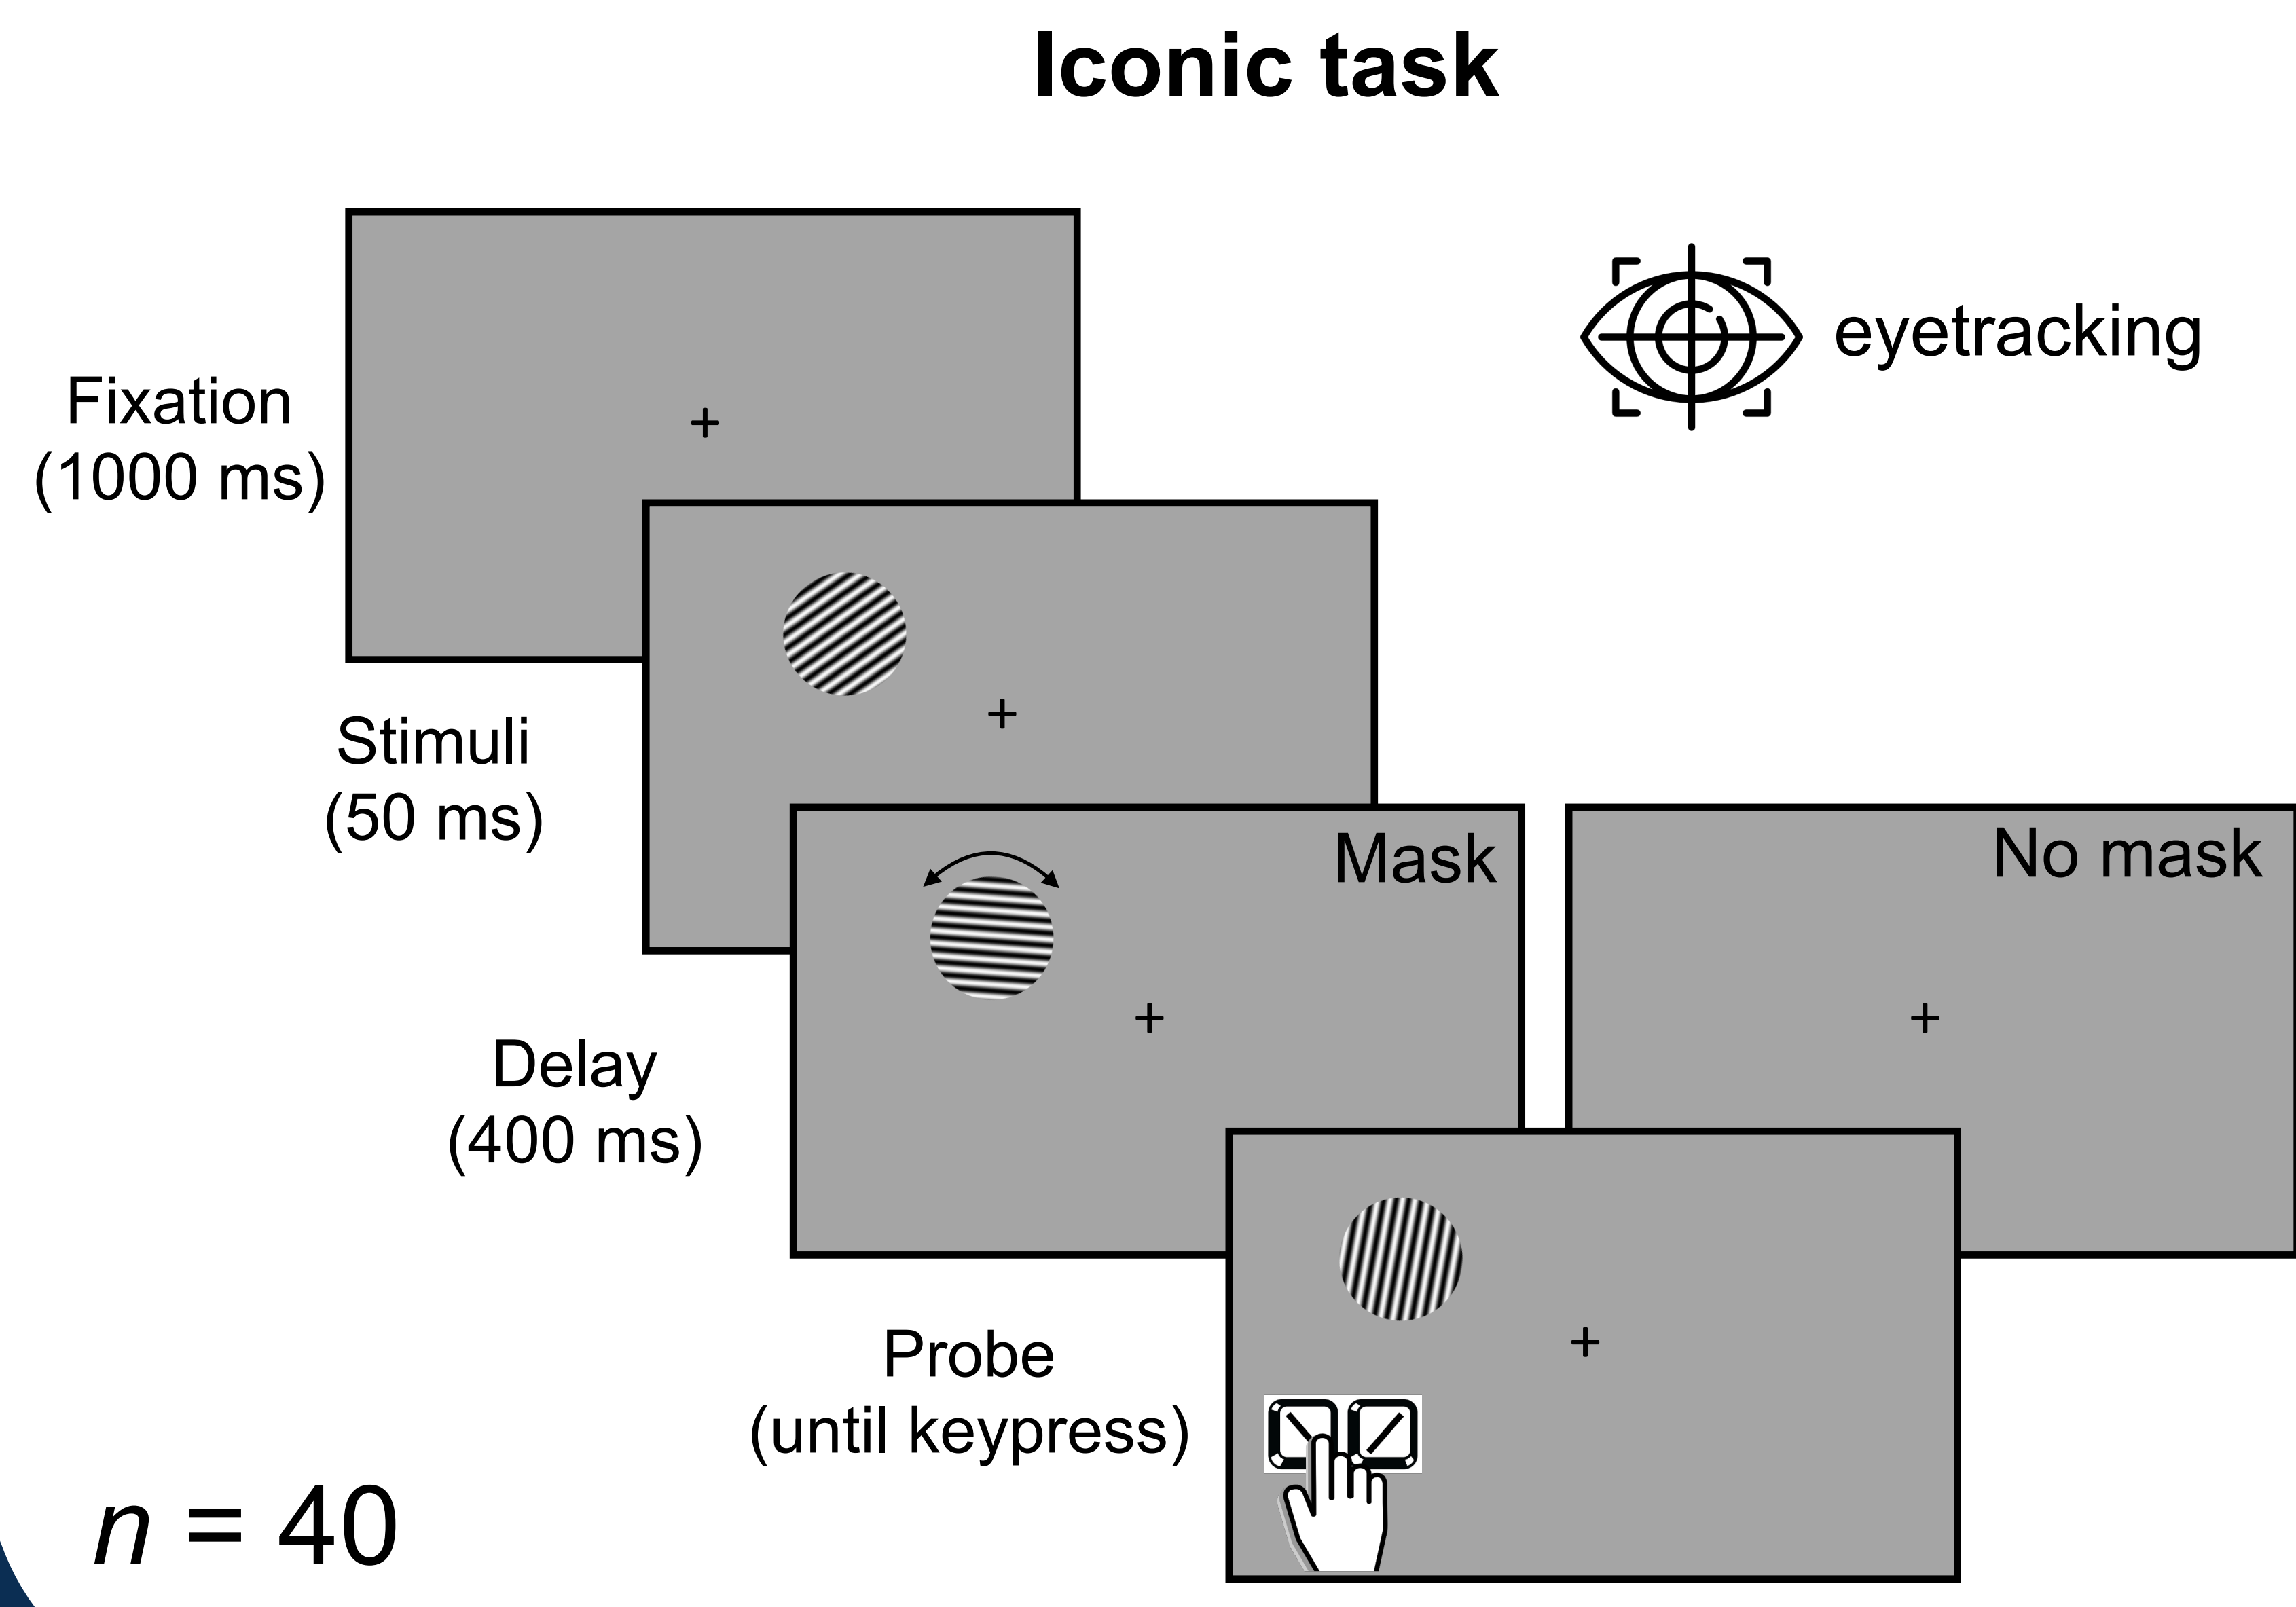

Caroline Myers and Justin Halberda
Johns Hopkins University

Significance

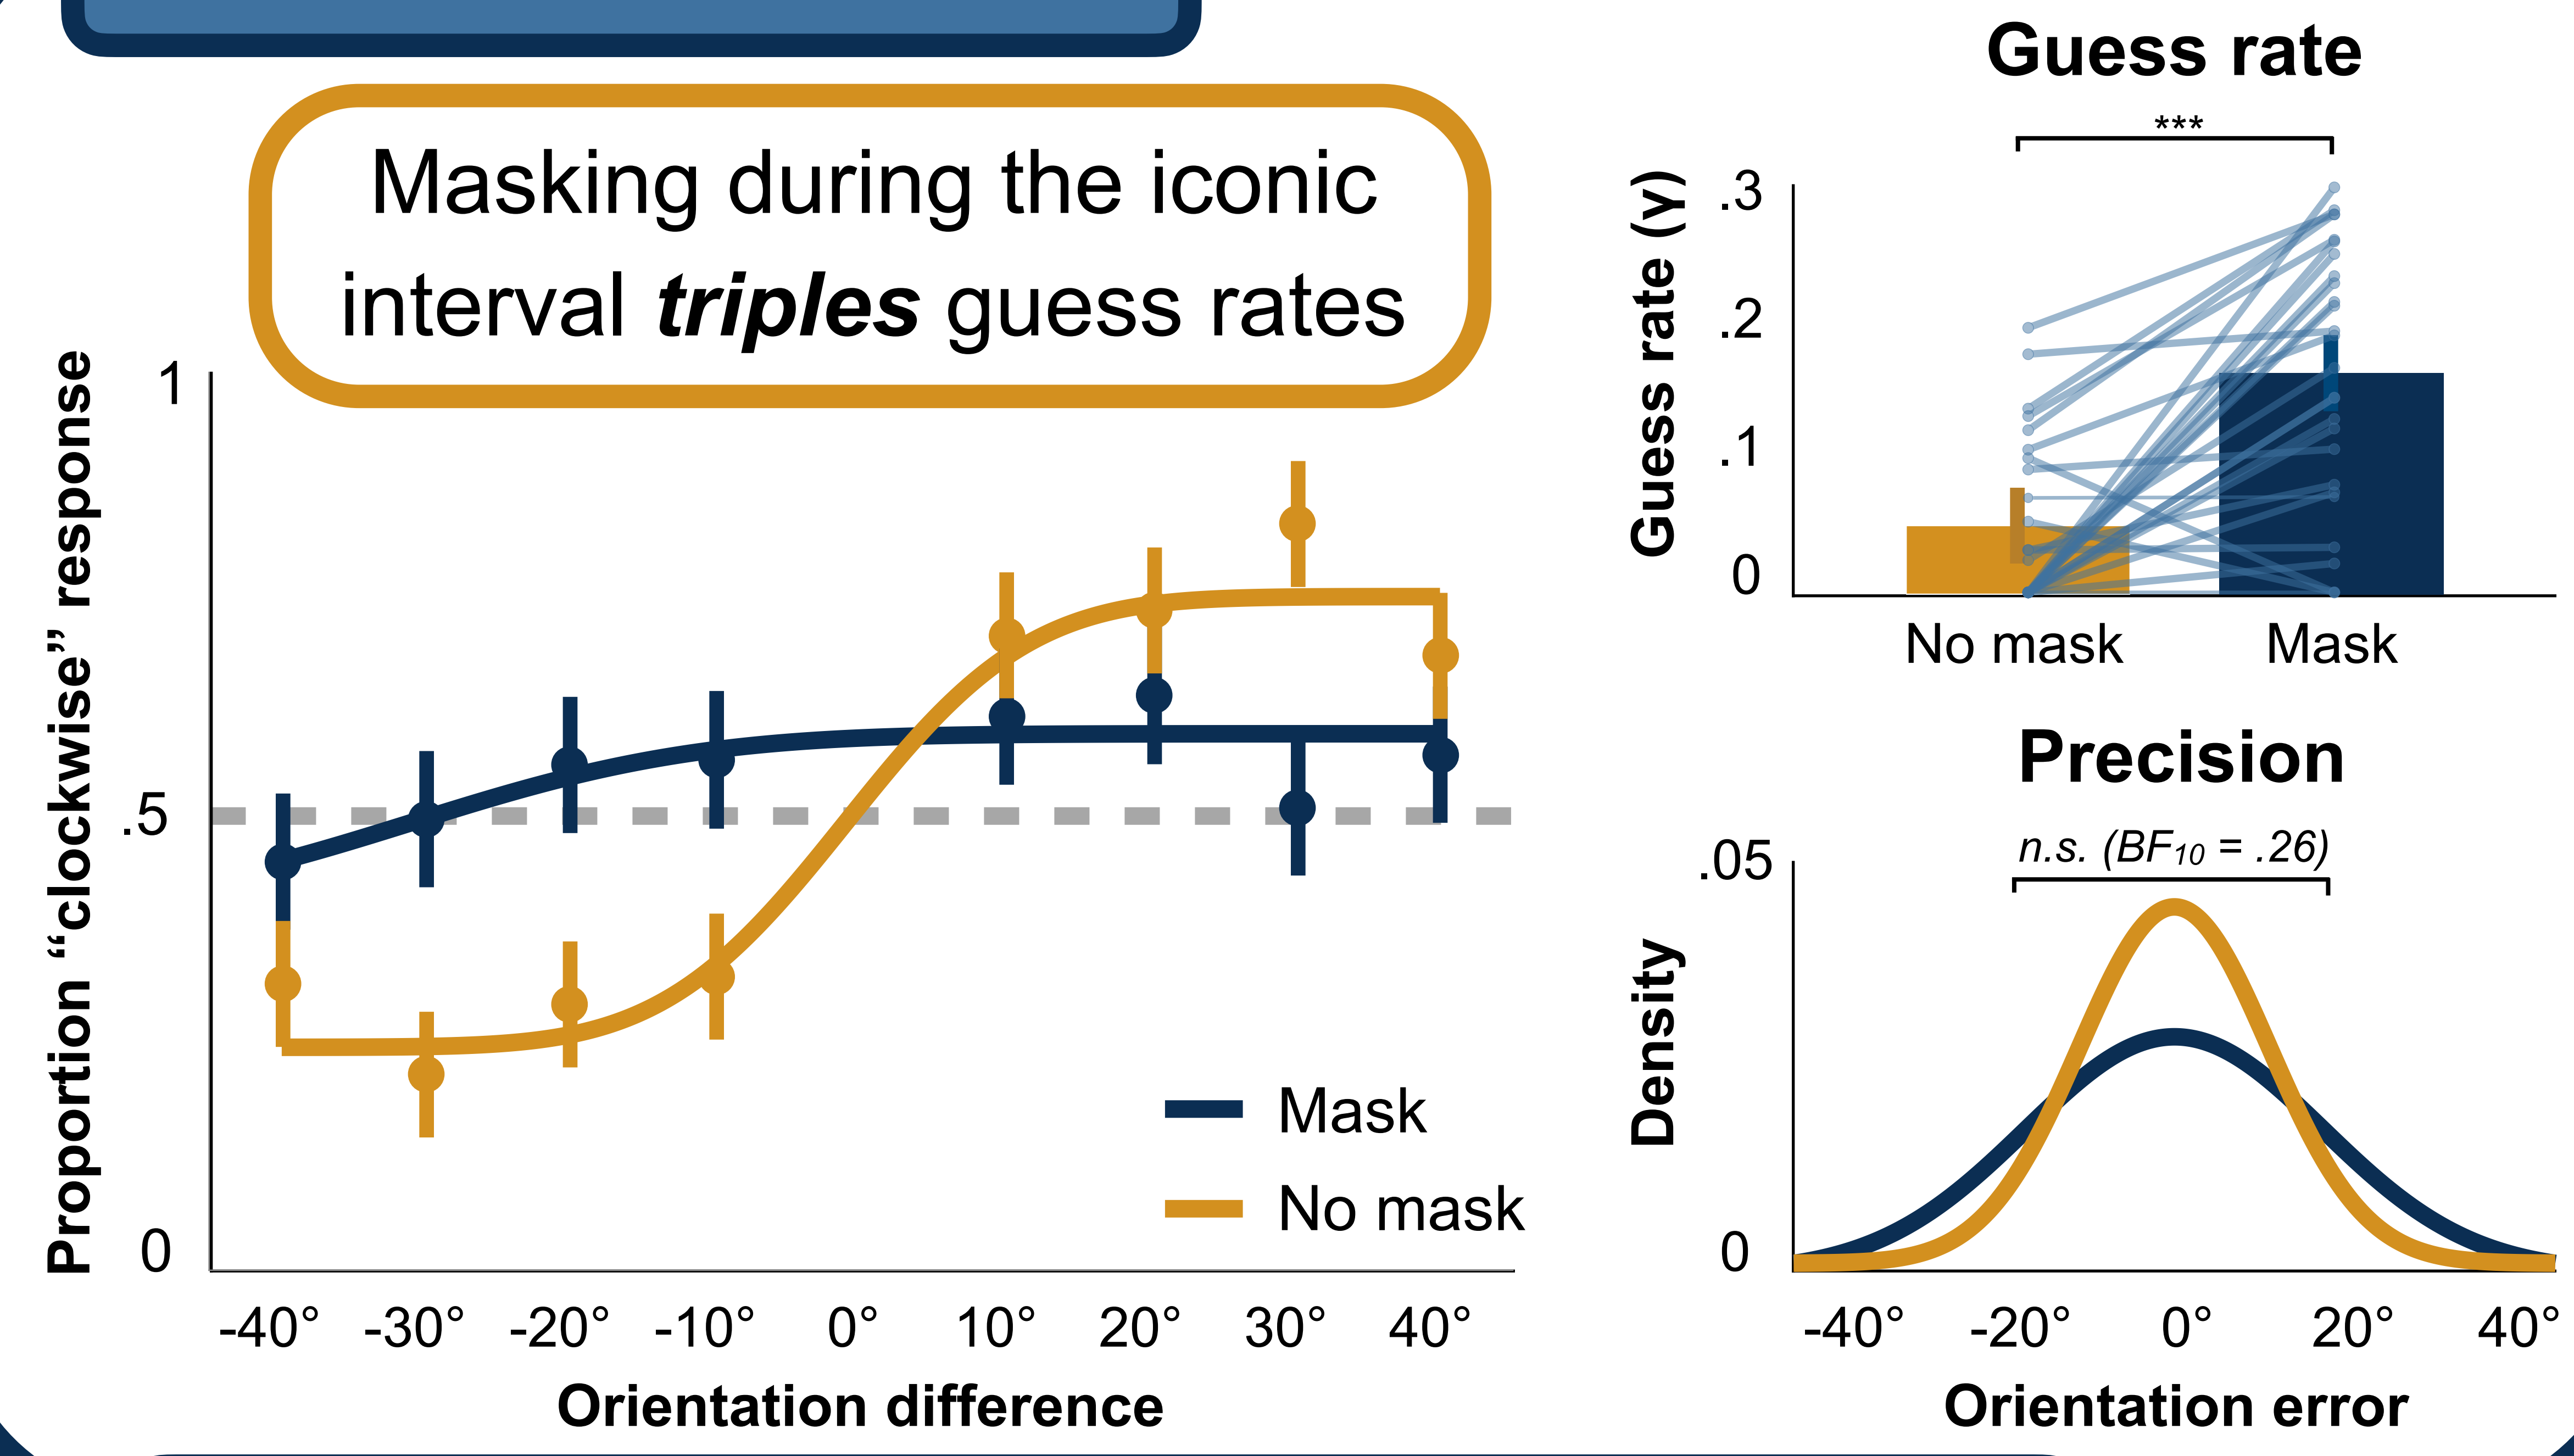

Some feedforward sensory recruitment accounts predict that **working memory should inherit the vulnerabilities of the perceptual code that supports maintenance....**

...including disruption by feature-matched interference at the remembered location.

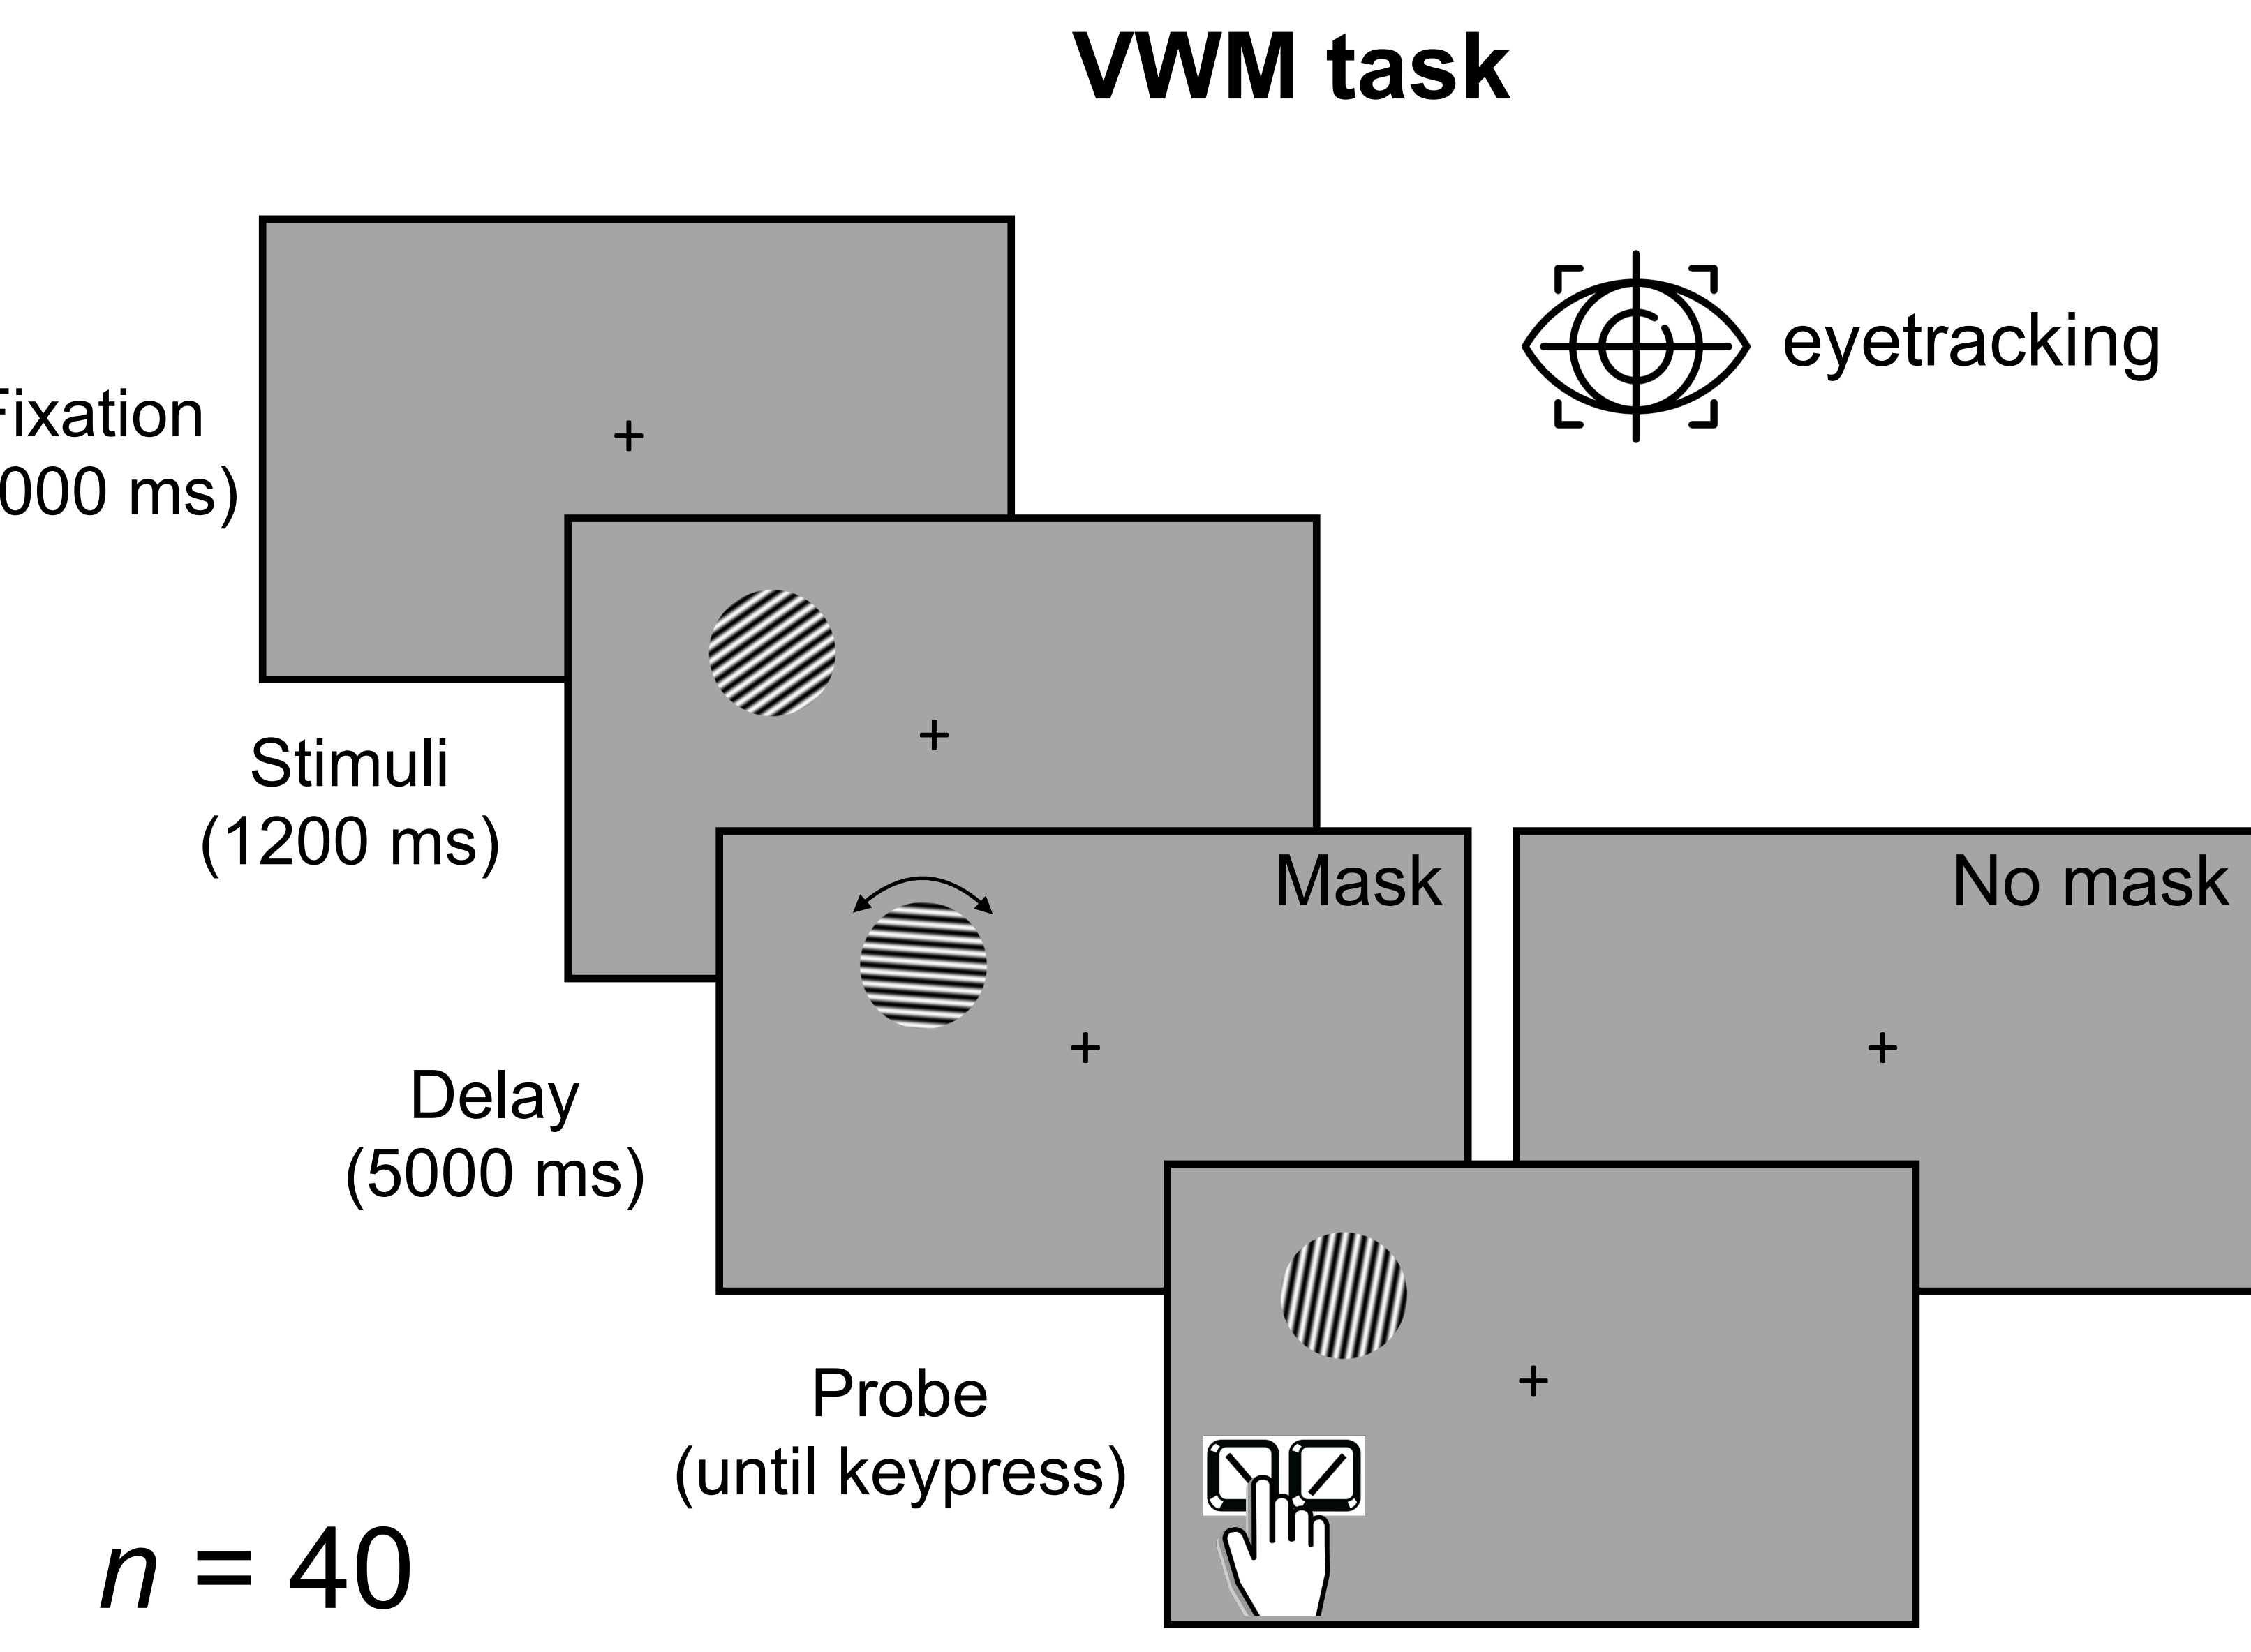

E1: Task and trial sequence (Iconic)

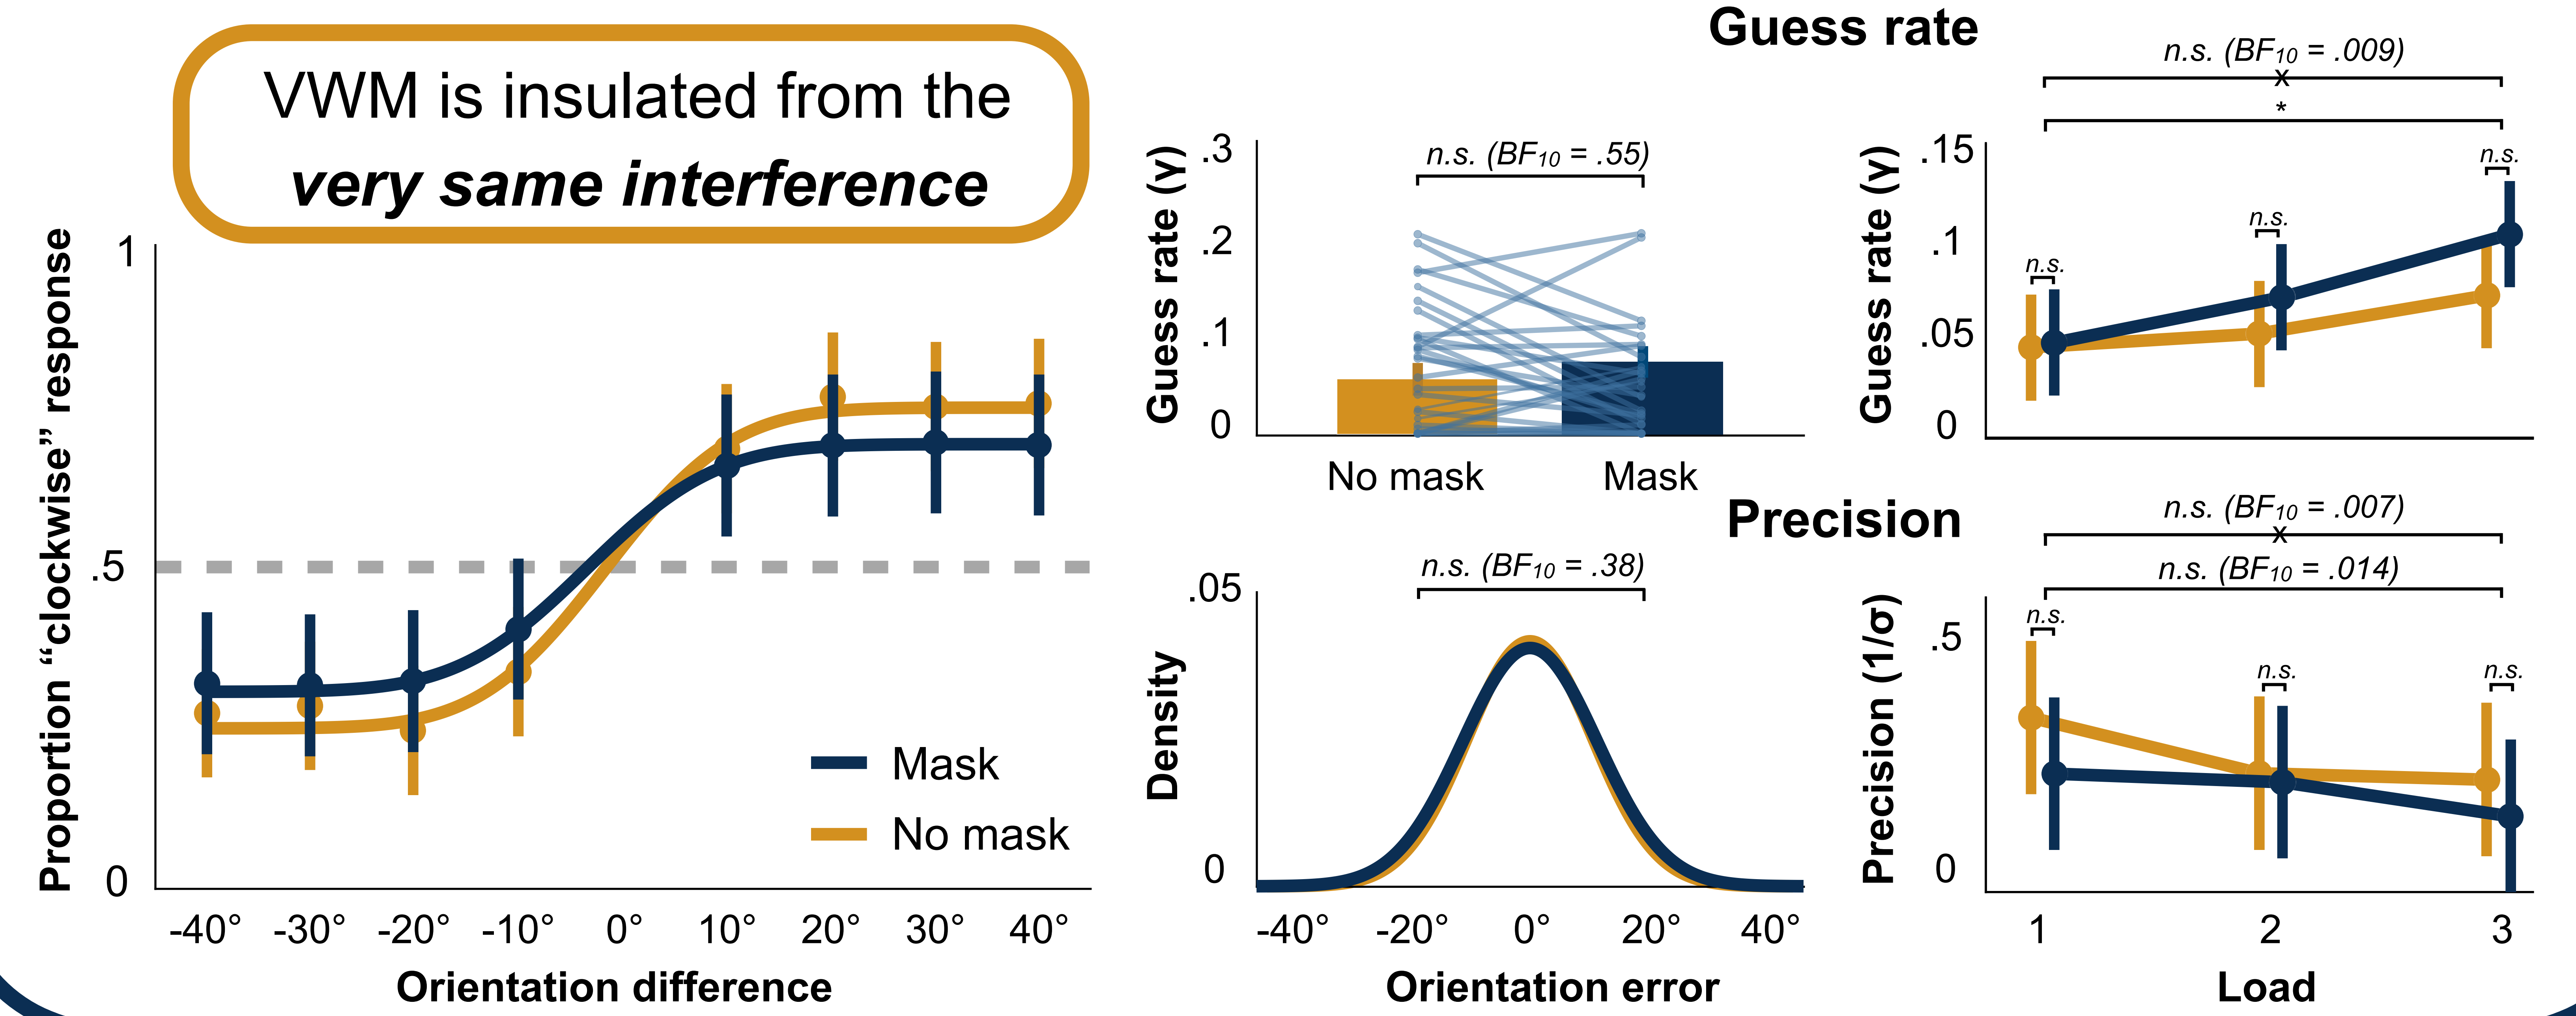

E1: Results (Iconic)

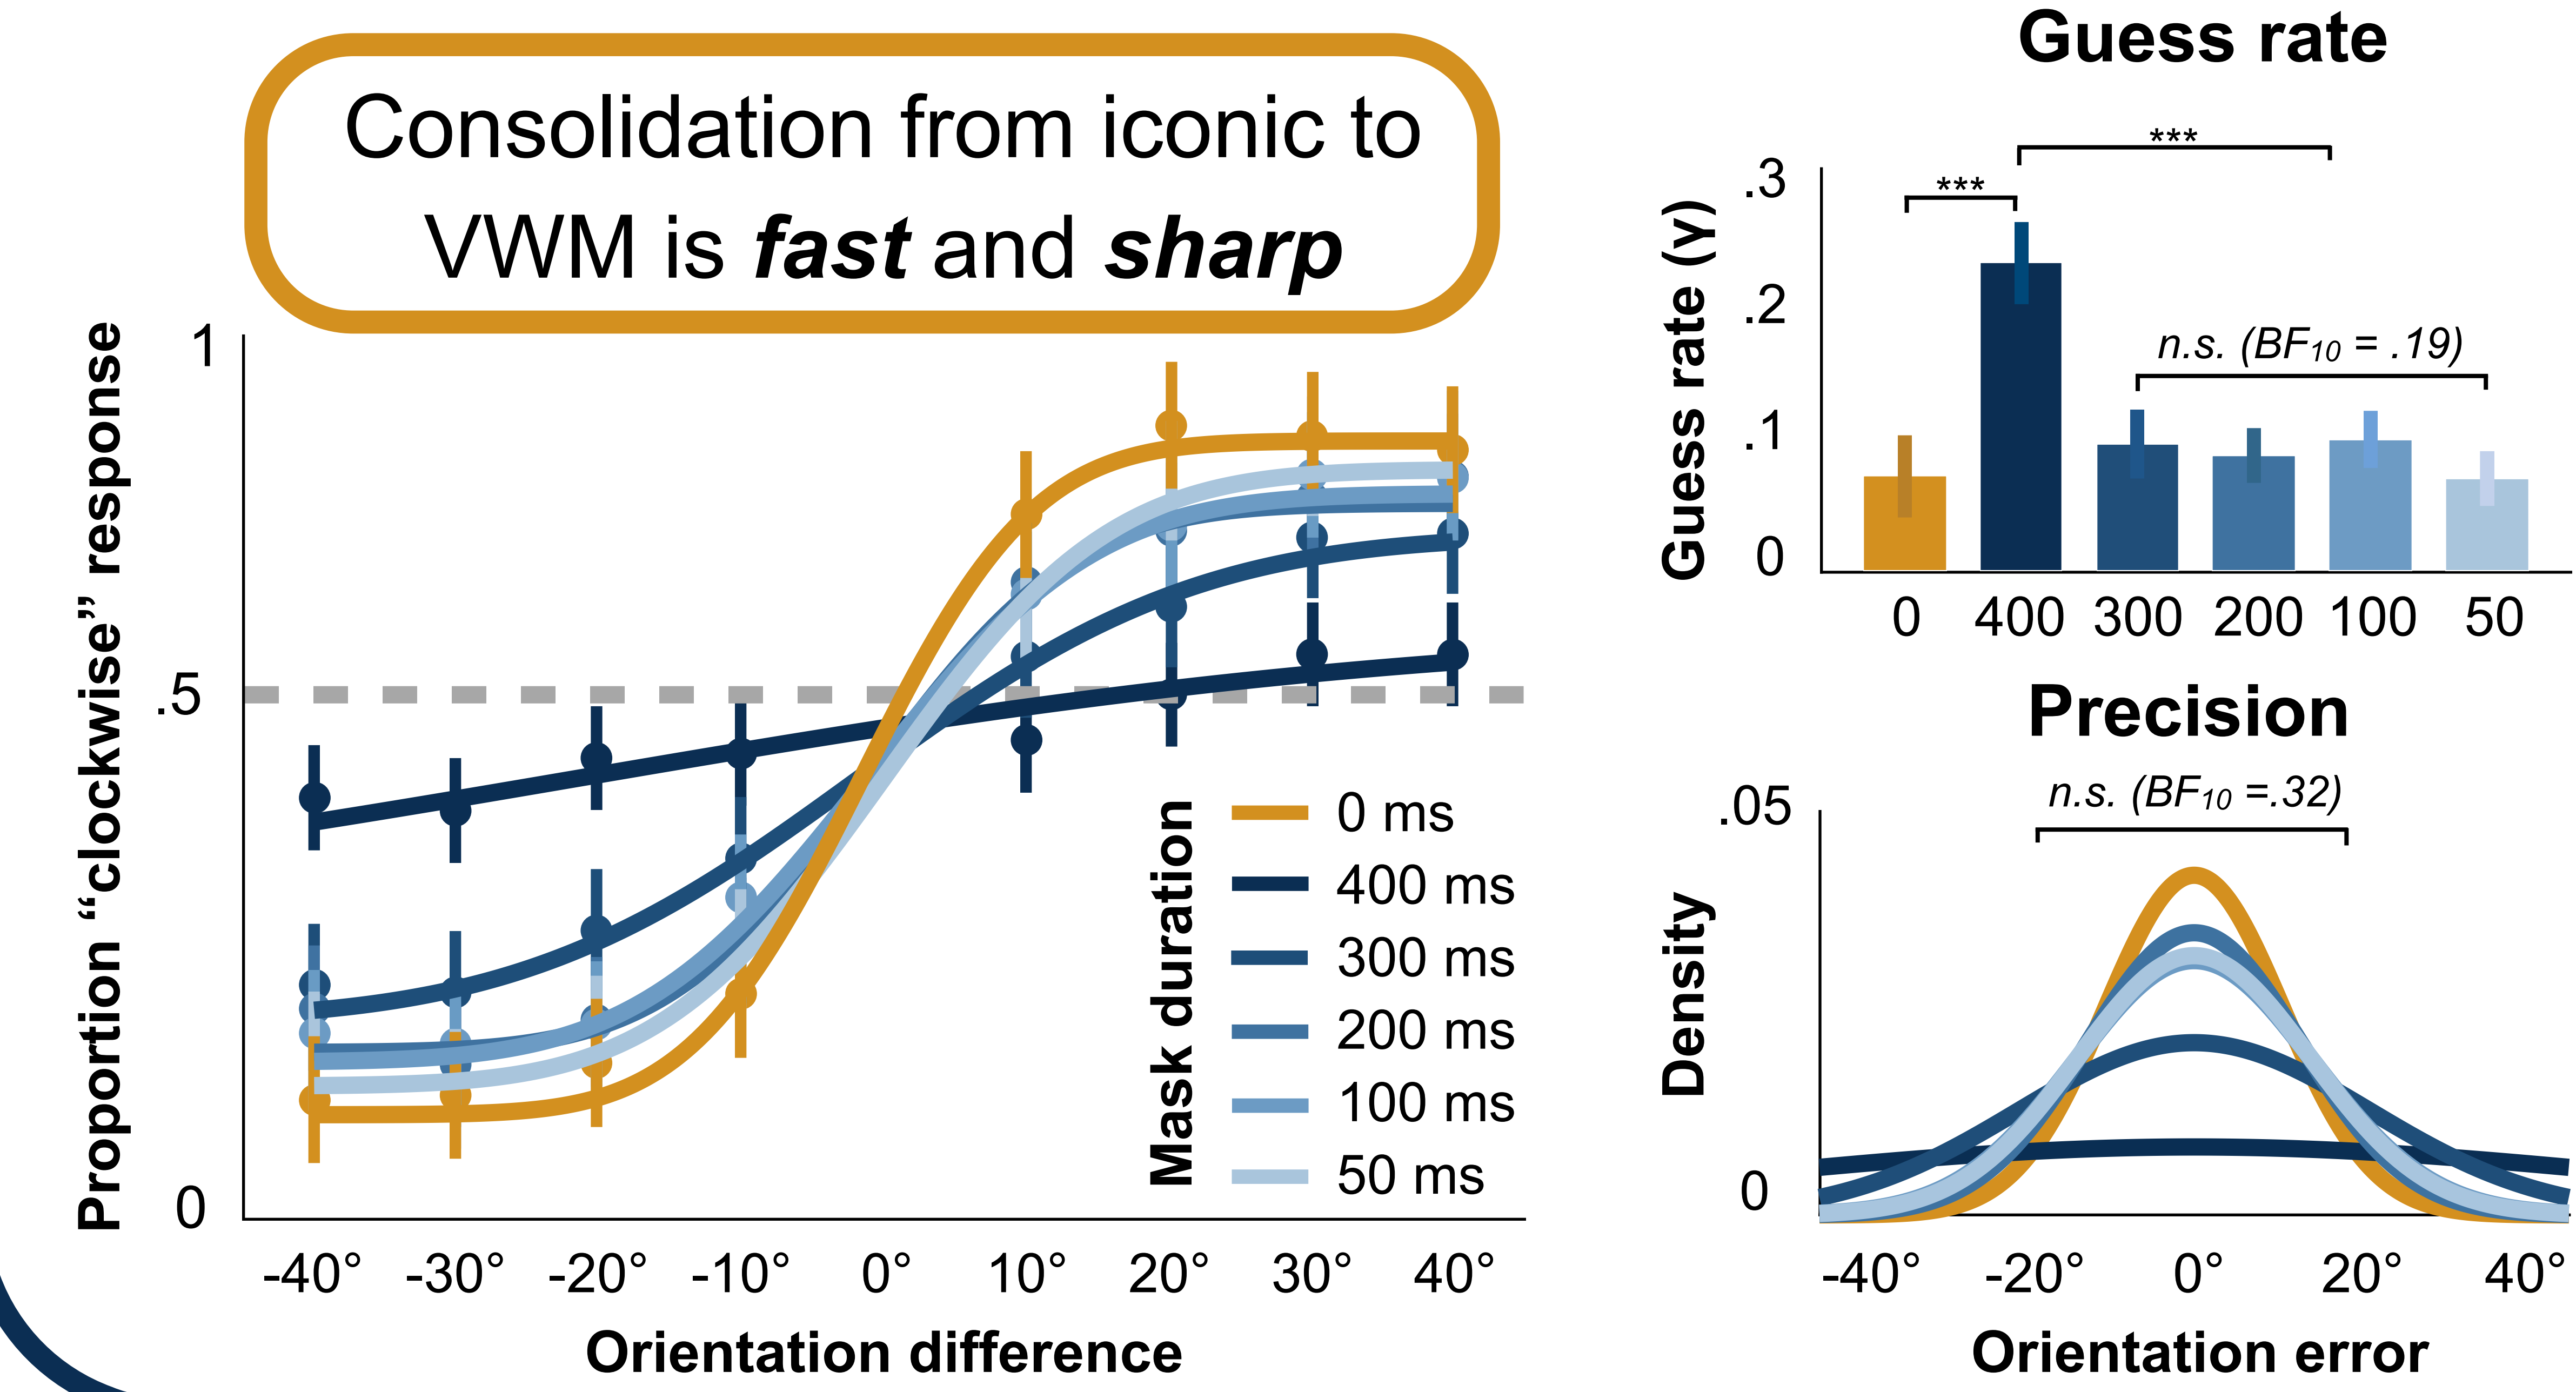

E2: Task and trial sequence (VWM)

E2: Results (VWM)

E3: Consolidation from iconic to VWM

Conclusions

Post-consolidation, VWM does ***not*** depend on the same sensory-format code that supports iconic persistence...

The durable format of visual working memory is *not* the iconic format of perception.
